

Towards Unsupervised Deep Learning

Michael C. Kampffmeyer

November 14, 2019

Due to the large improvements that deep learning-based models have brought to a variety of tasks, they have in recent years received large amounts of attention. However, these improvements are to a large extent achieved in supervised settings, while we are often challenged with a lack of labels in many application domains. This talk will present recent work on the unsupervised training of deep neural networks for clustering and zero-shot learning.
