

Neural Networks and Partial Differential Equations: Challenges and Opportunities

Philipp Christian Petersen

Proud member of the Applied Functional Analysis Group^{*†}

Novel machine learning techniques based on deep learning, i.e., the data-driven manipulation of neural networks, have reported remarkable results in many areas such as image classification, game intelligence, or speech recognition. Driven by these successes, many scholars have started using them in areas which do not focus on traditional machine learning tasks. For instance, more and more researchers are employing neural networks to develop tools for the discretisation and solution of partial differential equations. Two reasons can be identified to be the driving forces behind the increased interest in neural networks in the area of the numerical analysis of PDEs. On the one hand, powerful approximation theoretical results have been established which demonstrate that neural networks can represent functions from the most relevant function classes with a minimal number of parameters. On the other hand, highly efficient machine learning techniques for the training of these networks are now available and can be used as a black box.

In this talk, we will give an overview of some approaches towards the numerical treatment of PDEs with neural networks and study the two aspects above. We will recall some classical and some novel approximation theoretical results and tie these results to PDE discretisation. Afterwards, providing a counterpoint, we analyse the structure of network spaces and deduce from that some considerable problems for the black box solver.

The talk is based on joint work with Helmut Bölcskei, Philipp Grohs, Gitta Kutyniok, Felix Voigtlaender, and Mones Raslan.¹

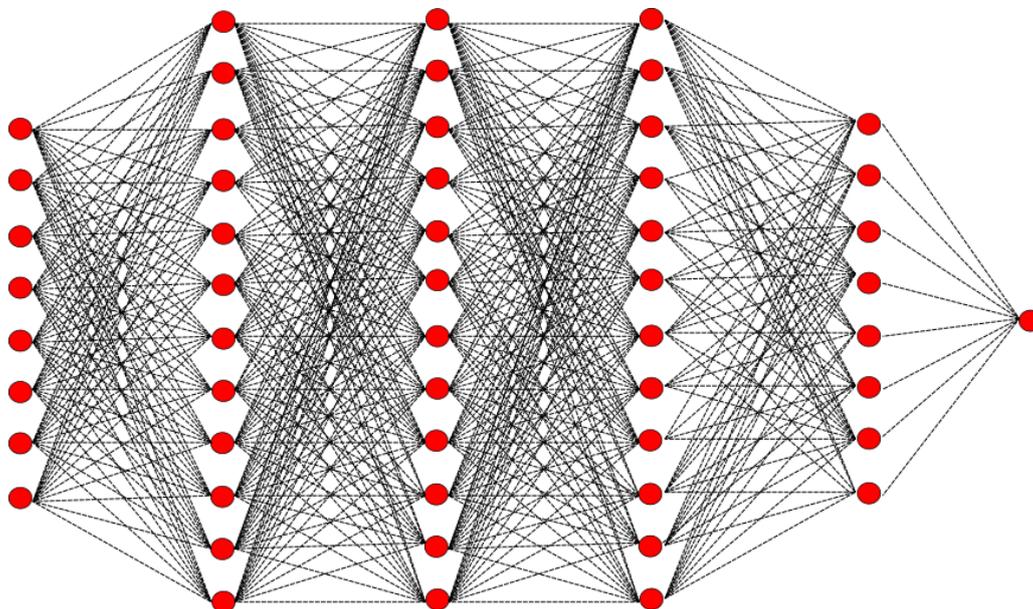

Figure 1: This is a neural network. We will find out much more about it during the talk.

^{*}Unfortunately, this will be my last Oberseminar talk as a member of AFG. I am sad, everyone else is probably also very sad, but I will bring cake to the talk to make us all feel better.

[†]I guess someone could invite me for the Alumni meeting. In that case I could give another talk. Maybe this is something to consider.

¹It is also supported by Martin's coffee machine and a whole lotta love from the AFG. Further mentions include the DFG collaborative research center TRR 109, the German State, Taxpayers all over Germany, the TU Berlin, the Far East India Journal of Pure and Applied Arithmetic and Clifford Algebras, as well as the European Union.
